

Instructions

Here is what is needed

- Rubber mat for workbench surface
- Cloths for wiping down product
- Box cutter for opening boxes
- 5mm bolt
- Magnetic hex bit holder for electric screwdriver
- #2 Philips bit for above
- 7mm nut driver
- Thread lock

Steps:

1. Carefully unbox outer and inner cartons by cutting packing tape on bottom of cartons.
2. Remove 502 from carton and remove from white protective pouch carefully.
3. Remove 12x Philips screws from around the outer edge of back panel.
4. Using a 5mm bolt, screw this into one of the existing open holes – it will push off the back panel (there is a gasket between the panel and enclosure that makes it 'stick').
5. Unplug transformer connector on the power amplifier board (circled in red), and both connectors to the drive units.
6. Remove the 2 screws that hold the transformer to the plate (circled in red).
7. Fit screening plate (Part no 5470 0402) using these 2 screws for location, using thread lock on the nuts.
8. Remount the 3 connectors.
9. Carefully insert the amp assembly back into the cabinet and replace screws.
10. Power up the product to ensure hum from tweeter is absent- some residual hiss is normal. Test with a signal source, such as MP3 player.
11. Wipe the monitor down with a soft cloth to remove any dust/ debris/ fingerprints.
12. Re-insert into its white protective pouch and re-apply tape.
13. Put monitor back into Styrofoam end-caps ensuring all accessories are included and re-seal inner box.
14. Insert inner box into outer sleeve ensuring cutout and serial # line up.

The following photographs are intended for reference. However, if you have any queries on the process, please contact service@tannoy.com

Unscrew Amplifier Panel

Remove Transformer Connector from PCB

Remove 2 Bolts using a #2 Philips screwdriver at the back and a 7mm nut driver on the inside.

Mount the bracket and nuts on the 2 exposed bolts as shown.
